Attempt : 1
Total Mark : 10
Marks Obtained : 10

Section 1 : Coding

1. Problem Statement

Amit wants to evaluate the depreciation of his car over time to understand its current value and categorize it based on that value.

Write a program that helps him determine the current value of his car after a certain number of years of depreciation and classify it into one of three categories:

High: If the current value is greater than 10,000.Medium: If the current value is between 5,000 and 10,000, both inclusive.Low: If the current value is less than 5,000.

The depreciation rate of the car is 15% per year. The program should calculate the current value of the car after applying this depreciation over the given number of years and print the current value along with the category.

Input Format

The first line of input consists of an integer, representing the initial cost of the car.

The second line consists of an integer, representing the number of years the car has been depreciating.

Output Format

The first line of output prints a double value, representing the current value of the car, rounded off to two decimal places "Current Value: <value>".

The second line prints its category "Category: <categories>".

Refer to the sample output for formatting specifications.

Sample Test Case

Input: 20000
5
Output: Current Value: 8874.11
Category: Medium

Answer

```
// You are using Java

import java.util.Scanner;
import java.text.DecimalFormat;

class CarDepreciation {
    public static void main(String[] args) {
        Scanner scanner = new Scanner(System.in);

        // Read inputs
        int initialCost = scanner.nextInt();
        int years = scanner.nextInt();

        // Depreciation rate
        double rate = 0.15;
        double currentValue = initialCost;
```

```
        // Calculate current value using a for loop
        for (int i = 0; i < years; i++) {
            currentValue = currentValue * (1 - rate);
        }

        // Format to two decimal places
        DecimalFormat df = new DecimalFormat("0.00");
        String formattedValue = df.format(currentValue);

        // Determine category
        String category;
        if (currentValue > 10000) {
            category = "High";
        } else if (currentValue >= 5000) {
            category = "Medium";
        } else {
            category = "Low";
        }

        // Output
        System.out.println("Current Value: " + formattedValue);
        System.out.println("Category: " + category);

        scanner.close();
    }
}
```

Status : Correct **Marks : 10/10**
